

Open Innovation and AI at ESA's Advanced Concepts Team

L. Summerer, D. Izzo, 14 November 2018

Created in 2002 *“to **monitor, perform and foster** research on advanced space systems, innovative concepts and working methods”*

“beyond the horizon multidisciplinary research for space, exploring new approaches to space related R&D (including competition, prizes, games), research for disruptive innovation, developing an expert network at academic level, and providing a capability for fast first look analysis of problems, challenges and opportunities”

no/weak links to space

basic scientific research

Immature, but need for a position

Exploring the *intersections* of disciplines

What if ...?
Could we ...?
What is needed to ...?
By when ...?

Fundamental Physics

Impact of new ideas in physics

Artificial Intelligence

Engineering of intelligent computer systems

Advanced Energy Systems

Innovating energy systems

Molecular Engineering

Manipulate and control the properties of molecules for space

Advanced Propulsion

Explore and review breakthrough propulsion concepts

Nanotechnology

Benefitting from control at micro/nano scale

Biomimetics & Bioengineering

Benefitting from Darwinian evolution to solve engineering problems

Neuroscience

Brain, sleep and microgravity

Mission Analysis

Mathematical techniques for future mission analysis

Computer Science & Applied Mathematics

Fast, efficient and parallel optimisation techniques

Space economics/Space architecture

Novel architecture & economic concepts for space sector

-> www.esa.int/act

Autonomous agents

- Neural controllers.
- Swarm intelligence for in-orbit self-assembly
- Optic flow and time-to-contact landings
- Biomimetic Sensing and Actuation

Machine Learning

- Deep learning in Deep space
- On-board real time optimal control
- Learning low-thrust connections

Evolutionary computations

- Evolving designs to find new solutions

- Deep CNNs for uncooperative targets pose estimation (in collaboration with Stanford)
- Real time embedded optimal control (in collaboration with TU Delft) with supervised (imitation) learning (powered by deep FFNN)
- Super resolution via CNNs
- New algorithms to enhance synergies between Machine Learning and Evolutionary Algorithms
- Neuro-evolution assessment
- Deep Architectures representation using Genetic Programming

Explored areas – Neurocontrollers

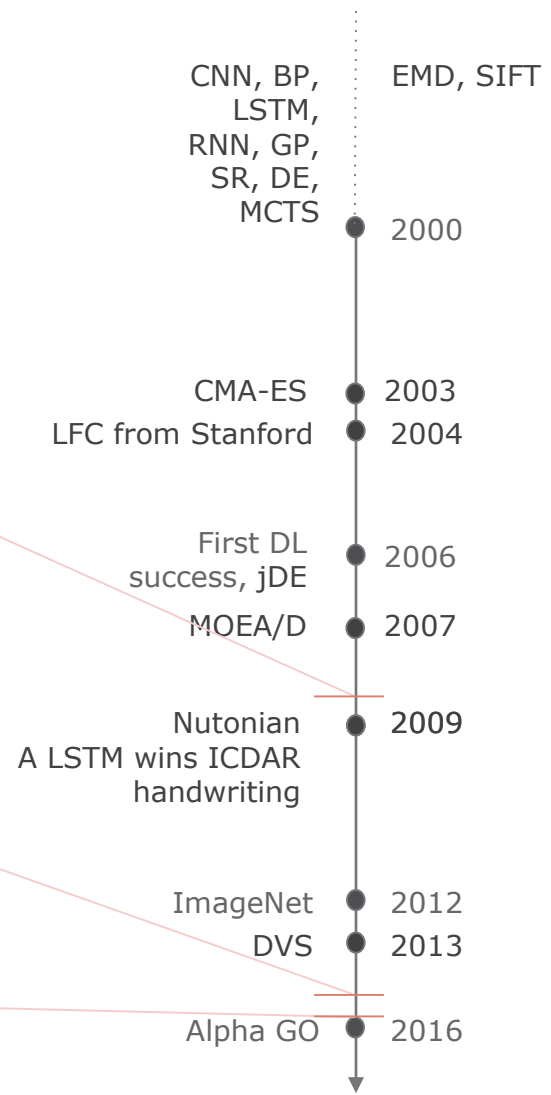

Evolution in robotic islands: ALife in the Galapagos

Reinforcement learning for Spacecraft hovering near unknown small bodies

Morphological evolution of soft robots at different gravity levels

Explored areas – Swarm Intelligence

Decentralized Formation Flight with collision avoidance:
Equilibrium Shaping

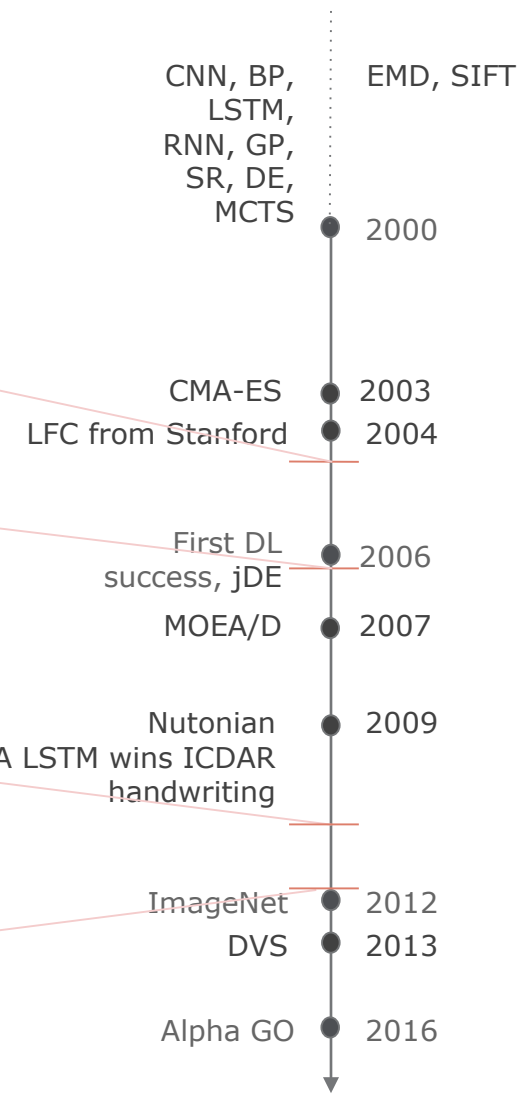

Autonomous self-assembly of large space structures

Root Swarm: Sensor webs deployment

ACT MIT SPHERES experiments: first ANN controlling
multiple (homogeneous) agents in space

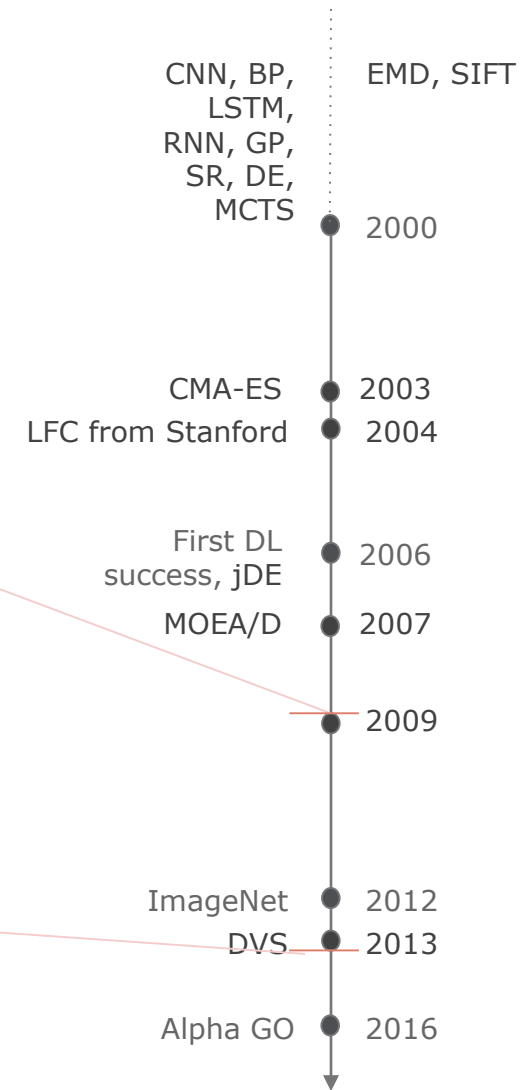

Explored areas – Biomimetic Sensing and Actuation

Optic flow based lunar landing: from bees to Apollo

Scent of science: from a female chasing moth to the chase of methane on Mars

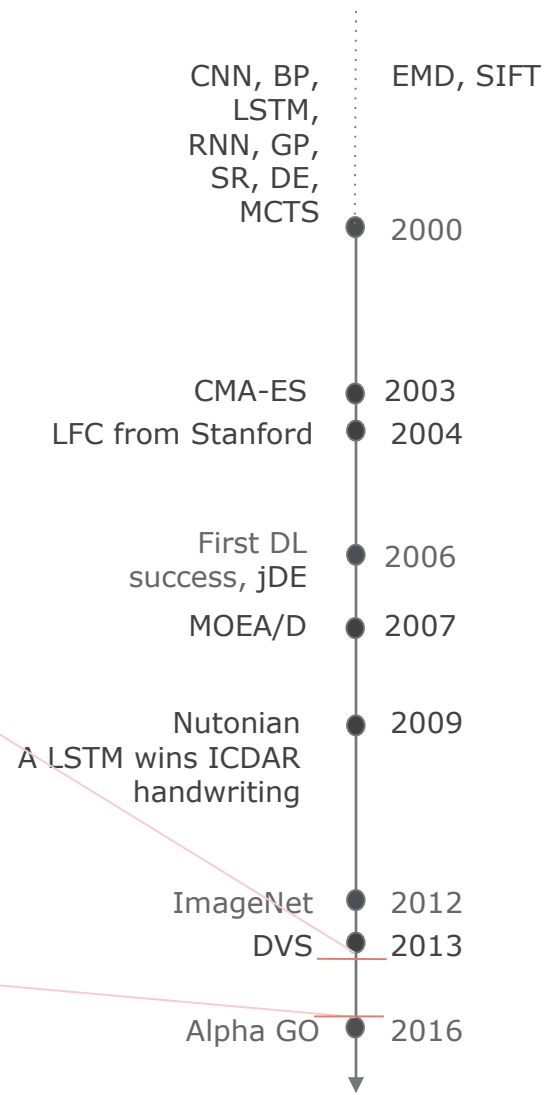

Explored areas – Vision

Astro Drone - gamification for the acquisition of vision data-sets

Learning "to see" in zero gravity - from stereo vision to monocular vision (using the MIT SPHERES platform)

Explored areas – Evolution and smart search

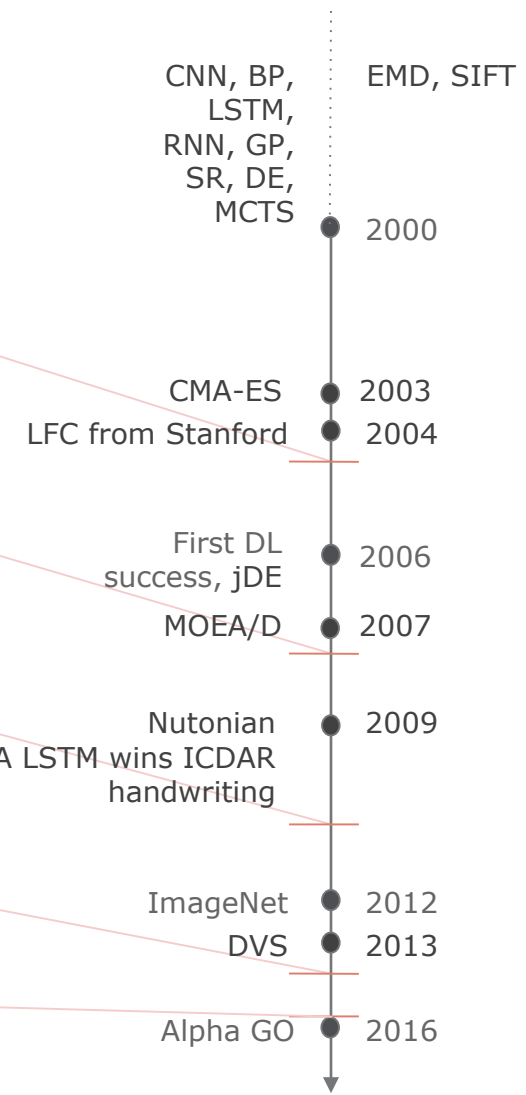

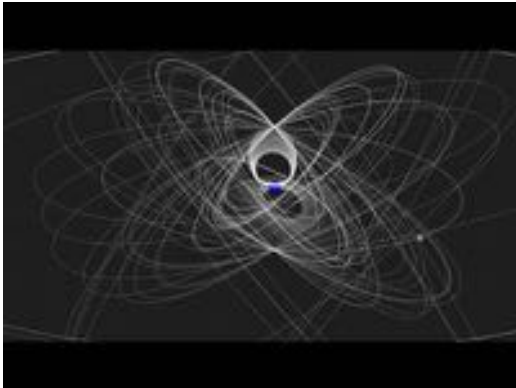

Evolution of Interplanetary Trajectories

Parallel evolution in modern CPU architectures, the island model, PyGMO

Novel tree search paradigms: Monte Carlo Tree Search, Ant Colony Optimization, Lazy Race Tree Search

Humies Gold medal - "for Human-Competitive Results Produced by Genetic and Evolutionary Computation"

1st place in the 8th edition of GTOC - "The America's cup of rocket science"

<https://kelvins.esa.int>

- Open science to foster competitive spirit and healthy scientific competitions
- Dedicated competition portal: Kelvins, reach the absolute zero (error)
- Harnessing ACT experience from GTOCs

Closed Competitions

GTOC 9

Win the America's cup of Rocket Science

Ended May 1, 2017

Show

Star Trackers: First Contact

Lost in Space

Ended Sept. 1, 2017

Show

Mars Express Power Challenge

Extend the Mars Express Orbiter Mission.

Ended July 11, 2016

Show

High and low resolution in comparison

Super-resolution

- Optical Super-resolution: improving an optical system beyond diffraction-limit
- **Geometrical Super-resolution:** Increasing resolution by image processing
- SISR (Single Image Super-resolution)
 - Inverting image degradation
 - Ill-posed problem
- MISR (Multi Image Super-resolution)
 - Video enhancements by fusing close frames
 - From multiple low to single high resolution
 - Deblurring / Denoising

Ledig, Christian, et al. "Photo-Realistic Single Image Super-Resolution Using a Generative Adversarial Network." *CVPR*. Vol. 2. No. 3. 2017.

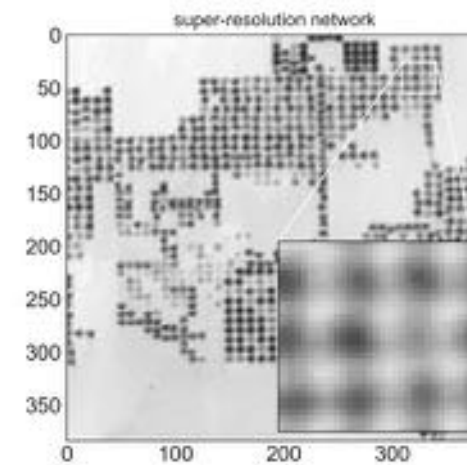

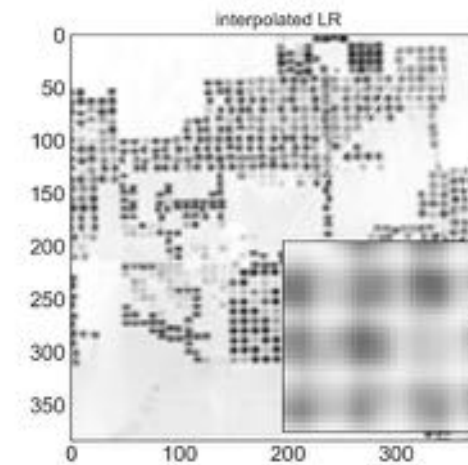

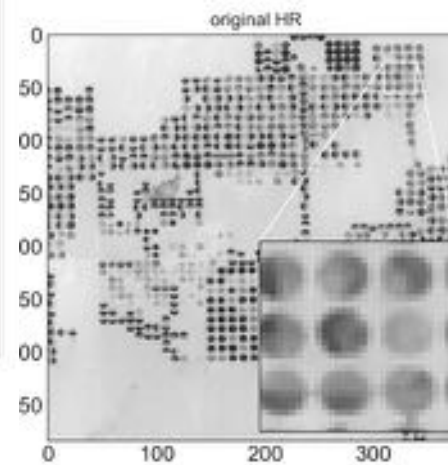

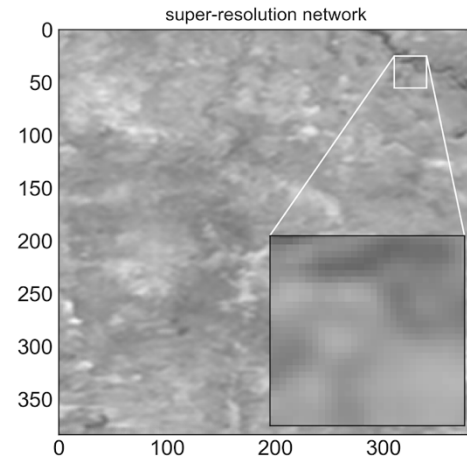

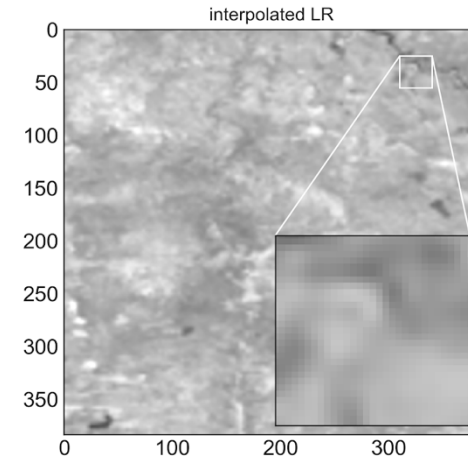

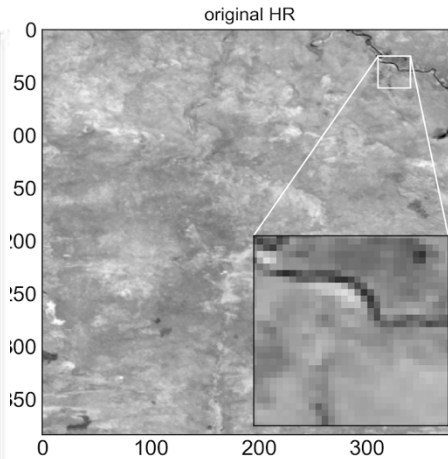

Sunkavalli, Kalyan, et al. "Video snapshots: Creating high-quality images from video clips." *IEEE transactions on visualization and computer graphics* 18.11 (2012): 1868-1879.

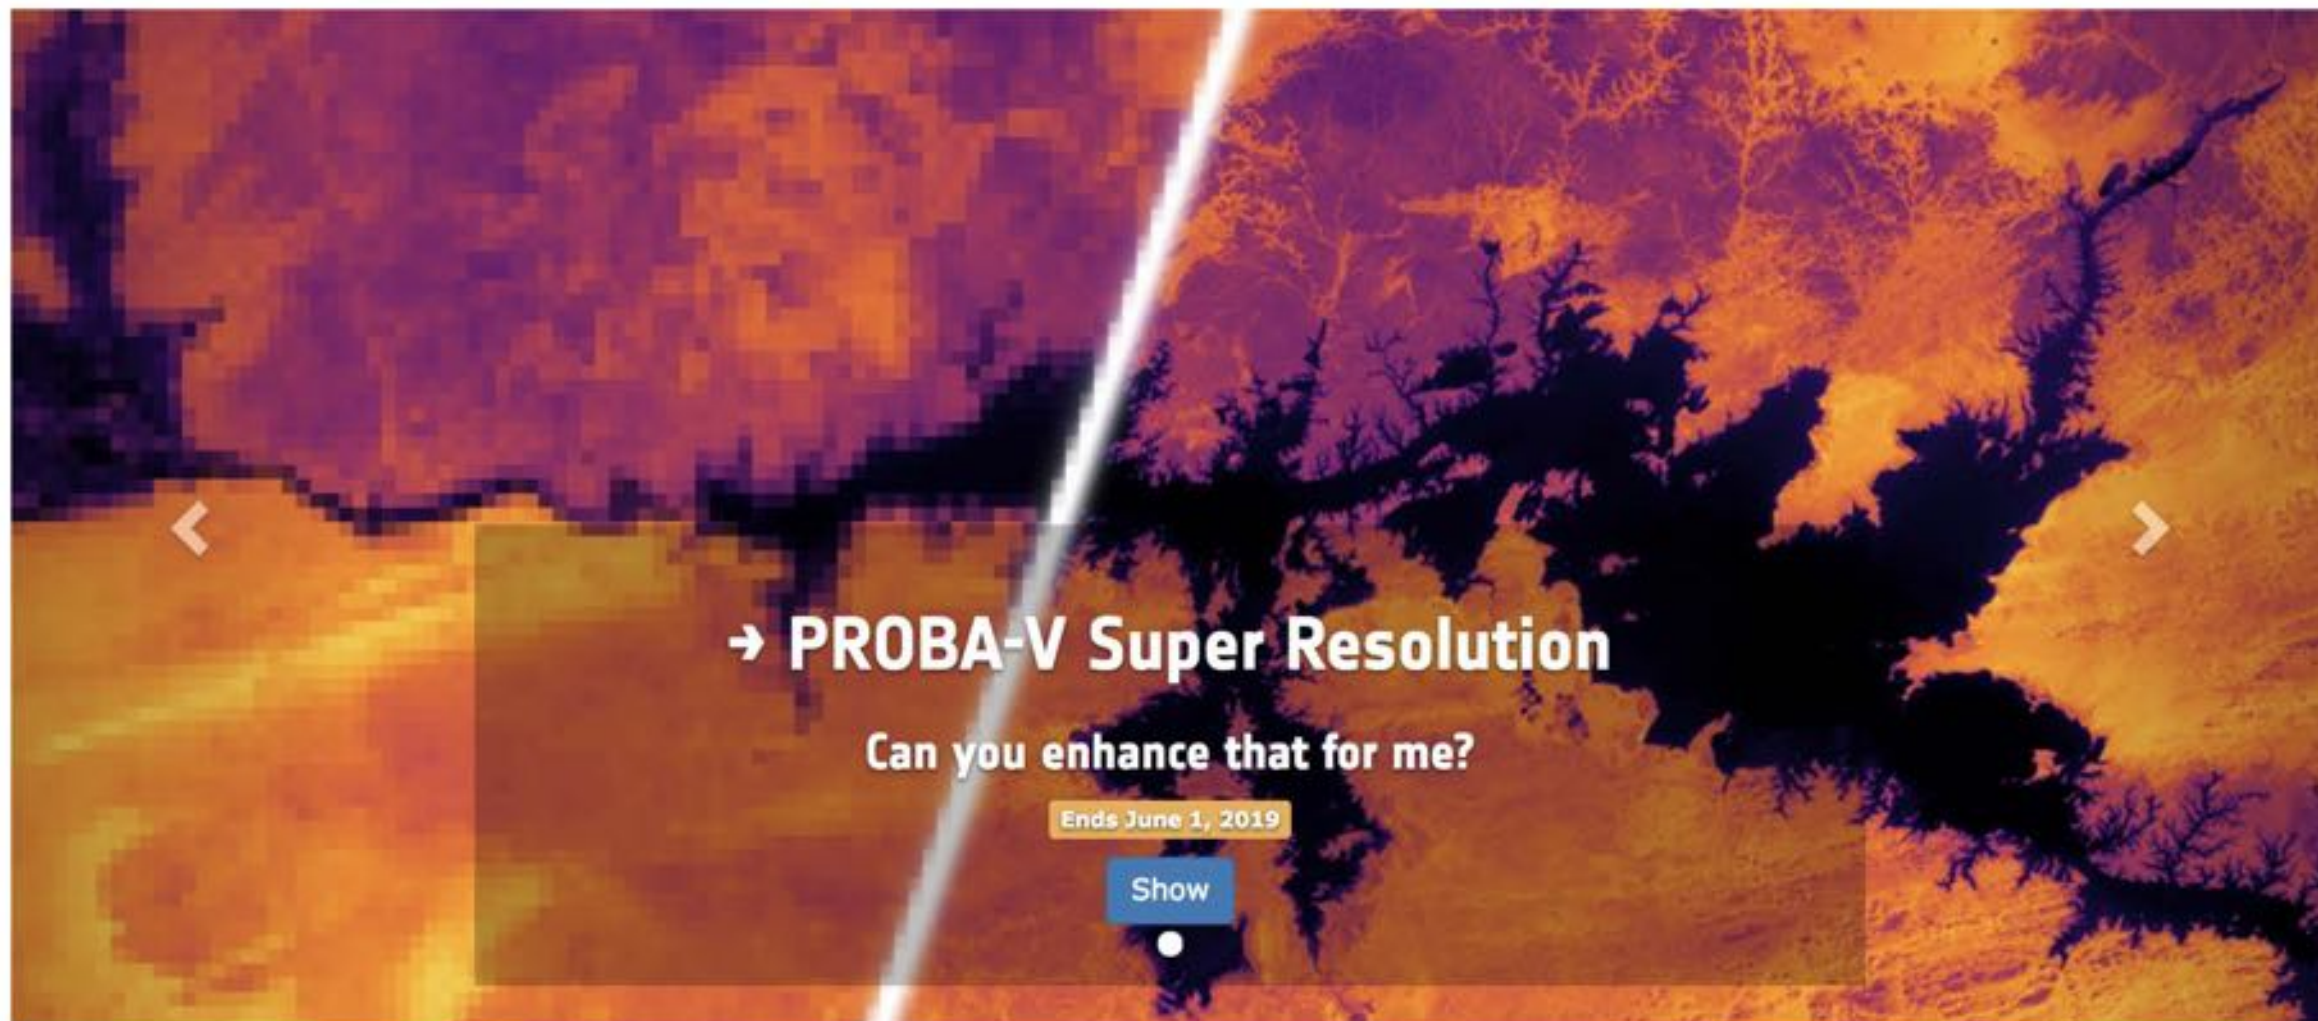

Super-resolution on satellites?

- **Single-pass Super-resolution** available in staggered sensor arrays
 - SPOT-5, ZY-3, TLC, SkySat-1
 - Post-processing on ground
- SPOT-5: two 5m shifted images by 0.5px are interleaved to 2.5m sampling
- Many ongoing cubesat projects
- **Multi-pass Super-resolution** still largely unexplored due to several challenges
 - Changes in cloud coverage
 - Changes in illumination
 - Changes in scene
 - Image registration

Preliminary results

→ **PROBA-V Super Resolution**
Can you enhance that for me?
Ends June 1, 2019
Show

The banner features a central image of a tree silhouette against a sunset sky, split vertically by a white diagonal line. The left side is a low-resolution, pixelated version of the image, while the right side is a high-resolution, sharp version. Navigation arrows are visible on the left and right sides of the image area.

About PROBA-V

- Launched 6th May 2013
- Provides Space-borne monitoring of vegetation
- Products:
 - 300m resolution
 - Near global (90%) coverage daily
 - 100m resolution
 - Global coverage ~5 days
- Geolocation mean accuracy: ~61m (± 50 m)
- NIR, RED, BLUE and SWIR
- Pixel quality maps for clouds, shadows, ice, etc.

Gathering longitudinal data

- 74 hand-selected ROIs
 - Geographical and vegetational “interesting” structures
 - Expected low cloud coverage
- One month of observations for each ROI
- Level L2A (radiometrically and geometrically Top-Of-Atmosphere reflectance)
- Plate Carré projection
- 300m resolution (**LR**)
 - Cloud coverage less than 40%
 - 128x128px, 16bit grey-scale
- 100m resolution (**HR**)
 - Cloud coverage less than 25%
 - 384x384px, 16 bit grey-scale
- In total: **1450 datapoints**, each consisting of
 - One HR
 - On average 19 LRs
 - Quality maps for all images

Cloud-patching

- Blending images to compensate for lost information

Demonstration
